Job Market Paper

The Doctor's Pen and the Payer's Bargain: Insurer Ownership of Primary Care

Lawmakers are moving to ban insurers from owning physician practices. Vertical integration can be efficient, if it eliminates double marginalization and disciplines hospital prices; consumers gain if the savings reach premiums. It can also be harmful, through foreclosure of rival insurers and inflating what the government pays Medicare Advantage plans. I study which forces dominate when an insurer is able to have market power in the primary care market, using a model in which insurers and practices bargain over prices and physicians choose how to code and refer patients. I find that rival insurers pay about 13 percent more for the same commercial office visit at the acquired clinics. The integrated insurer does not negotiate lower hospital prices, and its Medicare Advantage premiums do not fall relative to rivals'. Medicare pays more for enrollees of the integrated insurer post acquisition, despite no change in the care they receive. Specialist referrals fall by about 13 percent, with no change in hospital admissions or urgent care. In a market with the average U.S. hospital and physician concentration but with fragmented commercial insurers, the harms of integration dominate its efficiencies.
