Job Market Paper

The Doctor's Pen and the Payer's Bargain: Insurer Ownership of Primary Care

Lawmakers are considering bans on insurer ownership of physician practices. Such vertical integration can be efficient, if it eliminates double marginalization or otherwise disciplines prices; consumers gain if the savings are passed through to premiums. It can also be harmful, through foreclosure of rival insurers or inflation of government subsidies. I study five such channels in one case study: a national insurer's 2020 acquisition of the largest primary care group in a local Oregon market, using all-payer claims from 2017 to 2023. On the side of efficiency, the integrated insurer does not obtain lower hospital prices at the dominant local hospital system, and although the acquired clinics refer its enrollees to specialists about 21 percent less often than rival insurers' enrollees at the same clinics, with no rise in emergency department visits or hospital admissions, its Medicare Advantage premiums do not fall relative to rivals'. On the side of harm, integration leads rival insurers to pay about 13 percent more for the same commercial office visit at the acquired clinics, and Medicare pays more for enrollees of the integrated insurer after the acquisition, while their use of hospital, emergency and specialist care and their total spending do not rise. In a market with hospital and physician concentration typical of the U.S., fragmented commercial insurers and high Medicare Advantage enrollment, I find these harms, and any savings were not passed on to consumers.
